

Project Design Phase Proposed Solution Template

Date	[Enter Date]
Team ID	[Enter Team ID]
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	School IT support tickets are classified manually from the Short Description, so the Category and Subcategory can be missing or inconsistent and the Caller gets no automatic confirmation that the request was received.
2.	Idea / Solution description	A ServiceNow Flow, <i>Auto Classify School IT Tickets</i> , built in Flow Designer (Global application). It triggers on Record Created for the Incident Workflow table when Category is Empty, checks the Short Description with If / Else If conditions (Wi-Fi / Network, Projector, Forgot password, Slow Computer), uses Update Record to set the Category and Subcategory, and uses Send Email to confirm to the Caller. Status: in progress (Milestone 3).
3.	Novelty / Uniqueness	Classification and Caller confirmation are automated in one low-code flow on the ServiceNow platform, using simple keyword conditions with no external APIs or machine learning [Confirm what makes it unique for your course].
4.	Social Impact / Customer Satisfaction	Expected: Callers get an immediate confirmation, and consistent Category and Subcategory values help the school IT team sort tickets. To be validated after testing [Insert feedback or test results].
5.	Business Model (Revenue Model)	Not applicable: this is an academic project on a ServiceNow Personal Developer Instance with no revenue model [Confirm with faculty].
6.	Scalability of the Solution	More keywords, categories and subcategories can be handled by adding If / Else If conditions to the flow, which runs on the ServiceNow platform.
