

ServiceNow Development with Flow Designer

Project Documentation format

1. Introduction

- **Project Title:** Auto Ticket Classification using Flow Designer
- **Team Members:** [Enter Student Name / Team Members and Roles]

2. Project Overview

- **Purpose:** Automatically classify school IT support tickets. When a new Incident Workflow record is created, the flow checks the Short Description, assigns the Category and Subcategory, and emails the Caller a confirmation. This reduces manual classification and gives consistent ticket classification.
- **Features:** Flow “Auto Classify School IT Tickets” (Global application); Trigger: Record Created on Incident Workflow with Category is Empty; If / Else If classification on Short Description (Wi-Fi/Network, Projector, Forgot password, Slow Computer); Update Record for Category and Subcategory; Send Email to the Caller.

3. Architecture

- **Frontend:** No custom frontend. The flow is built in the ServiceNow Flow Designer builder and tickets are created through the standard ServiceNow interface.
- **Backend:** The Flow runs on the ServiceNow platform: Trigger (Record Created) → Condition (Category is Empty) → If / Else If on Short Description → Update Record → Send Email.
- **Database:** The ServiceNow Incident Workflow table. Fields used: Short Description, Category, Subcategory and Caller. No external database is used.

4. Setup Instructions

- **Prerequisites:** A ServiceNow Personal Developer Instance (PDI) with access to Flow Designer and the Global application. No external software dependencies.
- **Installation:** Step-by-step setup in Flow Designer:
 - o A new PDI was created after the previous one was terminated. [Done]
 - o Open Flow Designer and create the flow “Auto Classify School IT Tickets” in the Global application. [Done]
 - o Click Build Flow to open the builder. [Done]
 - o Configure the Record Created trigger: Table Incident Workflow, Condition Category is Empty. [In progress]
 - o Add the If / Else If branches with Update Record actions. [Planned]
 - o Add the Send Email action (Recipient: Caller > Email). [Planned]
 - o Activate the flow. [Planned]

5. Folder Structure

- **Client:** Not applicable — no client application is developed.
- **Server:** Not applicable — no server code. The flow is stored on the instance and is organised as: Flow “Auto Classify School IT Tickets” → Trigger → If / Else If (4 conditions) → Update Record → Send Email.

6. Running the Application

- The flow runs on the ServiceNow instance once activated; there are no local servers to start.
 - o **Activate:** click Activate in Flow Designer. [Planned]
 - o **Run:** create a new Incident Workflow record with a matching Short Description and empty Category. [Planned]

7. API Documentation

- Not applicable — no external APIs are used and no custom endpoints are exposed.

8. Authentication

- Sign-in and access control are handled by the ServiceNow instance. No custom authentication, tokens or sessions are implemented. [Confirm roles used, if required]

9. User Interface

- [Insert Screenshot: Flow Designer builder with the trigger and branches]
- [Insert Screenshot: Incident Workflow record form]

10. Testing

- Planned strategy: create test records whose Short Description contains “Wi-Fi” / “Network”, “Projector”, “Forgot password” and “Slow Computer”, and check the Category, Subcategory and the email to the Caller.
- Tool: ServiceNow Flow Designer (execution details). [Insert test results] — no tests have been run yet.

11. Screenshots or Demo

- [Insert Screenshot] / [Insert Demo Link]

12. Known Issues

- None recorded yet. The previous PDI was terminated, so the work was restarted on a new PDI. [Update after testing]

13. Future Enhancements

- [Confirm] Additional ticket types could be added by extending the If / Else If branches.
